

General information

If the fan noise emission exceeds an acceptable level, passive noise reduction measures must be taken. For this purpose, silencers can be used according to the absorption principle. This silencer type ensures good sound insulation with low pressure losses.

Helios offers silencers which are optimally adapted to the Helios fans. Round duct and rectangular duct silencers are available in corresponding casing shapes. Of course, all silencer types can also be used with fans of other brands.

Helios silencers have casings made of galvanised steel sheet and they are provided with baffles made of high-quality mineral wool, which are covered with an abrasion-resistant fleece against the air flow.

Technical information Sound insulation

The measure for sound insulation is insertion loss according to DIN EN ISO 14163. It shows the reduction in noise level in a round duct or rectangular duct piece with and without silencers determined by a comparison measurement.

For the measurement without silencers, a sound-reflecting piece is used instead. This determines the insertion loss:

 $\begin{array}{l} D_e = L_o - L_m \; dB \\ L_o: \; \text{Level without silencer} \\ L_m: \; \text{Level with silencer} \end{array}$

Since the effects of a silencer are highly dependent on the frequency, the insertion loss depending on frequency is specified.

The damping of low frequency noises requires more damper volume than the damping of high frequency noises and is therefore associated with higher costs.

For these reasons, a knowledge of the fan noise spectrum (octave and third octave spectrum) is required for the selection of a silencer. When acoustically assessing a ventilation system, it should be noted that other system components, such as bends, cross-section changes and branches also have a sound-insulating effect.

More detailed information can be found in VDI Guideline 2081 – noise generation and noise reduction in air-conditioning systems.

The lower limit for system noise emission is determined by the generation of flow noise in the silencer and in the system components. These increase significantly with increasing flow velocity. Therefore, the flow velocities should be kept as low as possible.

Quick selection of a silencer

An average insulation measurement is specified in the type table (red column far right) for the simple selection of round duct and rectangular duct silencers. This value should be deducted from the fan sound power level (L_{WA} tot.). The result is the fan sound pow-

er level reduced by the sound power insulation (L_{WA} reduc.).

This selection method, which shows differences compared to the frequency band calculation, is based on rounding. A calculation according to the octave band (see adjacent example) produces more accurate values.

Example:

Available: Fan type VARD 225/2 Selected: Duct silencer RSD 225/600 (installation length = 600 mm)

Fan sound power level L_{WA} tot. = 81 dB(A) Average silencer insulation measurement

minus = 15 dB(A) = Reduced sound power level L_{wA} reduc. = 66 dB(A)

Terms

 L_{WA} tot. = Fan sound power level in dB(A) (from table above performance diagram).

Average insulation measure-

ment = Derived damping capacity of the silencer in dB(A) (from red column in silencer type table).

 L_{WA} reduc. = Sound power level reduced by silencer insertion in dB(A).

Sound level calculation

In order to calculate the sound level after insertion of a silencer. the insulation loss by frequency band must be deducted from the fan band level and the total sound level can then be calculated. This is normally done in octave bands. Multiple silencers with the same diameter can be arranged one behind the other for larger insertion losses. The example below explains the procedure. Given task: Noise reduction of fan type VARD 225/2 (2800 min⁻¹) using silencers RSD 225/600 (basic length 2).

| | Octave mid-frequency Hz | | | | | | | | | | | |
|---|---|-----|-----|------|------|------|------|------------|--|--|--|--|
| | 125 | 250 | 500 | 1000 | 2000 | 4000 | 8000 | | | | | |
| A-weighted octave level L _{wa, oct} of fan VARD 225/2 | 51 | 62 | 74 | 76 | 76 | 72 | 63 | dB(A) | | | | |
| A-weighted total sound power level $L_{\scriptscriptstyle WA}$ | $L_{WA} = 81 \text{ dB}(A)$ | | | | | | | | | | | |
| Insertion loss of silencer D _e RSD 225/600 (2 x basic length) | 4 | 10 | 17 | 27 | 25 | 17 | 14 | dB | | | | |
| A-weighted octave level $L_{\mbox{\tiny WA, Oct}}$ of fan with silencer | 47 | 52 | 57 | 49 | 51 | 55 | 49 | dB(A) | | | | |
| A-weighted total sound power level L_{WA}^{\star} of fan with silencer | $ \begin{array}{l} L_{WA}^{*} = \\ 10 \cdot Ig \; (10^{47 \cdot 0.1} + 10^{52 \cdot 0.1} + 10^{57 \cdot 0.1} + 10^{49 \cdot 0.1} + 10^{51 \cdot 0.1} + \\ & = 61 \; dB(A) \end{array} $ | | | | | | | +1049.0.1) | | | | |
| Associated A-weighted sound pressure level at 1 m distance | L _{pA} * = 53 dB(A) | | | | | | | | | | | |

Dimensions KSD

Rectangular duct silencer KSD

Design – Installation

Casing made of galvanised steel sheet, with connection flanges, dimensionally matched to the rectangular duct fans, for insertion on the inlet and outlet side of the rectangular duct system. The silencers upstream or downstream of the fan must be provided with a flexible connector (VS or VS Ex) to the further duct system to prevent structure-borne noise transmission.

Pressure loss

Rectangular duct silencers cause flow resistances (adjacent diagram) which must be taken into account for the design. These values apply for uniform flows. In case of non-uniform flows (e.g. for the outflow from rectangular duct fans), a straight duct piece at least 1 m in length must be used or allow for higher resistances.

Dimensions FSD

Flexible cross talk silencer FSD

Design – Installation

Robust design made of flexible aluminium duct. Perforated inner lining with resin-bonded sound insulation lining approx. 50 mm thick. Double-sided connectors, which can be inserted in the duct or connected to the fan or duct using a pipe clamp connector BM. The flexible design facilitates installation.

Pressure loss

Four times the friction resistance is taken into account for the system calculation.

Dimensions RSD B Dim. see table

Design – Installation

Casing made of galvanised steel sheet. Lining with high-quality mineral wool, which is equipped with a fleece on the flow side for protection against abrasion. The dimensions and fixing holes of all sizes are based on the standard fan diameter (R 20). The fixing holes correspond to DIN 24155, p. 2.

Insertion loss

Multiple silencers with the same diameter can be arranged one behind the other for larger insertion losses.

Pressure losses

The flow resistances of the RSD silencer are very low. Twice the friction resistance is taken into account for the system calculation.
